Homework

You have to create a single page customer management app.

Requirements

Customer registration

- I need to be able to register a customer. Form should have these inputs:
    - Full name
    - Email
    - Address
        - City
        - Street
        - House number
        - Zip code
- Customer address should be valid location on a map. Validate using Google Maps API.

Listing customers

- I need to be able to see already registered customers in a list.
- I need to be able to delete customer from a list.

Other requirements

- Use any front-end framework you want (you can use VanillaJS as well)
- You can use CSS framework for layouting
- Write unit tests to critical parts of the application
- Use local storage for saving customer information
- Please provide instructions for running your app in README.md

Happy hacking.
